

# GOLD

## Grease One-Way Logistics and Distribution

The GOLD Dispensing System allows you to conveniently, cleanly, and efficiently dispense grease from ExxonMobil's bulk grease disposable container. This innovative bulk container system addresses the cost, contamination, safety issues, and hassle sometimes associated with traditional metal or plastic totes and drums.

In 2004, ExxonMobil plans to offer select Exxon and Mobil greases in an amazingly durable, flexible, multi-layered disposable container that holds 1800 lbs of grease. This technology has been used successfully in Europe for over ten years. Grease is discharged from the container through the GOLD Dispensing system.

### How you can benefit:

**Return freight costs are eliminated** - No messy totes to clean, repair, or return. The collapsible container is used once and then easily disposed of and consists of non-toxic materials and components

**Less waste** - completely collapsible design of the GOLD Bag leaves behind less grease than a typical drum, yet holds the equivalent of 4.5 drums, thanks to the GOLD Dispensing System that stretches the bag when discharging. Residual levels as low as 0.5%

**Clean grease** - since the closed system prevents contact with air and contaminates product quality is protected. Product is filled under vacuum thus eliminating air pockets that can hinder ability to pump grease from traditional totes

**Cost savings** - less residual product, less product loss due to contamination, return freight elimination for returnable totes, no drum disposal costs, less labor associated with moving residual grease to new drum

**Ease of use** - elimination of drum handling and related safety issues
